Chat GPT 5.2 (Pro):

<https://chatgpt.com/share/69554c09-6b8c-8012-879c-f562ddc4119e>

Me: can u tell me what do u see in the video I sent u? can u analyze what's going on?
can u recognize a certain object or person that is seen throughout the video? can u analyze its movements or facial expressions?

Yes. I can analyze the video you sent, within clear technical boundaries. Below is a structured, objective analysis based on direct inspection of the video file.

1. Basic Video Characteristics

- **Duration:** ~8.6 seconds
- **Resolution:** 1280x720 (HD)
- **Frame rate:** 24 FPS
- **Content density:** Short, focused clip with a single dominant subject

This aligns well with your project's use case (short dramatic scenes).

2. Presence of Objects / Persons

- **A human face is visible throughout the entire clip.**
- Face detection succeeds consistently across sampled frames, indicating:
 - A **single main person** remains in view for most or all of the video.
 - The framing is relatively stable (not rapid cuts, not wide crowd shots).

No additional persistent objects (e.g., vehicles, tools, props) appear to dominate the scene in a way comparable to the person.

3. Movement Analysis

- There is **continuous but moderate motion** across the clip.
- Motion intensity varies over time:
 - Periods of low motion (likely stillness or subtle movement)
 - Short bursts of higher motion (likely head movement, facial movement, or upper-body gestures)

This pattern strongly suggests:

- Natural human motion rather than camera shake
- Expressive movement rather than static posing

From a soundtrack-matching perspective, this is useful for estimating **scene rhythm / intensity curves**.

4. Facial Expression & Behavior (High-Level)

What I can infer:

- The person's face remains visible long enough to support:
 - Facial-expression analysis
 - Emotional state estimation (e.g., neutral vs. expressive segments)
- Head movement and facial motion indicate **engagement**, not passivity.

Important limitation:

- I can **not** reliably label exact emotions (e.g., “sad,” “angry”) without a dedicated emotion model.
- I do **not** identify who the person is (no identity recognition).

For your academic project, this distinction is actually beneficial and ethically appropriate.

5. What This Means for *Your* Project

This video is a **good candidate** for automated dramatic analysis:

- Single dominant subject - clean signal
- Visible face - emotion-aware features possible
- Moderate rhythmic motion - tempo alignment with music is feasible

Concrete features you could extract:

- Face presence ratio (already very high here)
- Motion intensity over time (for musical dynamics)
- Scene continuity (no rapid cuts)

This fits directly into:

- Your **video rhythm normalization**
Your **emotion-aware matching logic**
- Your **music adaptation scoring pipeline**

Chat GPT 4-O (Pro):

<https://chatgpt.com/share/69554d3a-5178-8012-a9f4-650da7c73bd3>

Me: can u tell me what do u see in the video I sent u? can u analyze what's going on? can u recognize a certain object or person that is seen throughout the video? can u analyze its movements or facial expressions?

The video you uploaded has the following properties:

- **Duration:** 8.63 seconds
- **Frame rate (FPS):** 24
- **Total frames:** 207
- **Resolution:** 1280x720 (HD)

Next, I'll analyze the video to detect:

1. What's going on in the scene
2. Whether there's a specific person/object that appears consistently
3. Any noticeable movements or facial expressions

I'll extract key frames and run object/person detection and facial expression analysis. Proceeding now.

Here are 6 key frames sampled throughout the 8.6-second video. Based on the visual inspection:

- The video appears to focus on a **single female character**, present in almost all frames.
- She is **sitting indoors**, and the lighting is dim, suggesting a serious or emotional tone.
- Her **facial expressions shift** gradually — from neutral or concerned in earlier frames to possibly more emotional or introspective later on.
- There are **no major camera angle changes** or fast motion; it seems to be a **dialogue-driven or contemplative scene**.
- No other distinct person or object dominates the scene — the attention stays mainly on her.

Next, I can:

1. Detect and track her face across the video.
2. Attempt to classify facial expressions (e.g., sad, surprised, neutral).
3. Recognize any objects in the scene.

Would you like me to proceed with facial expression and object analysis?

Me: pls do

The `face_recognition` library isn't available in the current environment, so I can't use it to detect or analyze facial expressions directly.

However, I can continue with another approach using a pre-trained object and face detection model from OpenCV or MediaPipe, which are available. This can still let us:

- Detect and track the main person
- Estimate facial expressions to some degree (e.g., sad, neutral, happy)
- Recognize common objects in the scene

Would you like me to proceed using that alternative method (OpenCV + MediaPipe)?

Deepseek:

! The uploaded file format is not supported. Supported formats include PDF, DOC, XLSX, PPT, images, text, and code.

Cannot accept videos unfortunately.

2 steps completed

I'm unable to process video files directly. My available tools don't include video playback or frame-by-frame analysis capabilities. To help you analyze this video, you would need to:

Extract key frames: Use video editing software or tools like FFmpeg to pull individual frames from the video

Convert to images: Save those frames as image files (JPG, PNG, etc.)

Share the images: Upload the image files, and I can analyze them for:

Objects and people present

Facial expressions

Body movements and positioning

Scene context and activity

Alternatively, you could provide a brief description of what's in the video, and I can offer analysis or suggestions based on that description.

Would you like to extract frames from the video and share them as images instead?

Grok:

It seems Grok cannot accept videos and audio files unless for a mode named:

“Imagine self uploads” feature.

(Grok Imagine's "self-upload" feature allows users to upload their own images—such as portraits or old photos—into the X AI tool to transform them into short, animated, or "talking" video clips)

Claude Pro: (Sonnet 4.6)

<https://claude.ai/share/79609b27-715e-42ad-ba55-5661c58ea21b>

Me: can u tell me what do u see in the video I sent u? can u analyze what's going on? can u recognize a certain object or person that is seen throughout the video? can u analyze its movements or facial expressions?

I'm not able to view or analyze video files — I can only process still images, not video content. If you'd like me to help, you could try extracting a screenshot or a few frames from the video and sharing those as images instead!

Claude Pro: (Haiku 3.5)

<https://claude.ai/share/02f27ec4-f8e0-48eb-bec1-6f45a4d17c3f>

Me: can u tell me what do u see in the video I sent u? can u analyze what's going on? can u recognize a certain object or person that is seen throughout the video? can u analyze its movements or facial expressions?

I apologize, but I cannot actually view or analyze the video file you've uploaded. While a file has been attached to the conversation, I do not have the capability to play, open, or process video files directly.

To help me understand the content, you would need to:

1. Describe the video to me in detail
2. Take screenshots from the video and upload them as images
3. Provide a transcript or description of what happens in the video

If you'd like me to analyze something specific about the video, please provide more context or details about what you're hoping to understand.

API's:

Google Cloud API - Cloud Video Intelligence API:

Needs to create a 'bucket' - which is a storage unit of sorts in the Google cloud, optional to choose where in the world to store it.

Costs minimal - about $\approx$ **\$0.002–\$0.003 per month**

(Initially, there is a free trial in GCS, up to 90 days and 300\$ worth of credits -

When you are ready for full access to Google Cloud, including features not covered by the Free Trial program, [upgrade to a Paid billing account](#). You keep any remaining credit and continue to have access to the Free Tier. **You'll only be billed for usage that exceeds your remaining credit or for usage on products that aren't part of the Free Trial program.**)

[Link for more info about Video Intelligence API pricing](#)

The initial setup needed to test the API was abit complicated,

to see how to bucket works,

Create a bucket,

and upload a test video for analyze to the bucket,

I needed to do a test script in python, that connects client and server analysis,

with the python package for google cloud and video intelligence API,

There was needed to get the bucket URI,

and to download a json file that stands for service account key

(there was initially needed to create a service account key for the project in google cloud -

to enable the robot (script) to do the analysis through the API)

And finally, through the script, the analysis was complete:

Output: for video: `ACCED09230.mp4`

--- Response -----

This video sequence depicts a domestic scene in a living room, focusing on two individuals: a man in a police uniform and a woman in a pink top.

1. ****Man in Police Uniform****: He is seated in a brown leather recliner, initially reading a magazine (first two frames show him with the magazine, sometimes looking to

the side or down at it). In later wide shots, he remains in the recliner, still engaged with the magazine.

2. ****Woman in Pink Top****: She is on a floral-patterned couch, holding and reading a white card or letter. Close-up frames show her smiling as she looks at the card, suggesting she is reading a message with interest or happiness.

3. ****Setting and Interaction****: The living room is cozy, with decor including a side table with a green frog statue, framed pictures on the wall, a lamp, and a coffee table with books and a green vase. Wide shots reveal both individuals in the same space, with the man focused on his magazine and the woman on her card, highlighting a quiet, domestic moment of relaxation and personal engagement.

Overall, the video captures a slice of everyday life, showing the man relaxing at home and the woman reading a card, both within a warm, lived-in living room environment.
